

24 screens, 8 flows.

Low-fidelity structure only. Visual language lives in AJO-DES-001; behaviour in AJO-PRD-001; scope matches the MVP build sheet (Stripe Connect rail, FakeRail test double, no trust-profile page, no i18n). Names and figures are placeholders.

p.2	F1 Onboarding	01 Welcome · 02 Create account · 03 Verify email
p.3	F2 Identity & rail	04 KYC handoff (Stripe Connect) · 05 Checks pending · 06 Home, empty state
p.4	F3 Wallet	07 Wallet & activity · 08 Top up · 09 Withdraw
p.5	F4 Create a circle	10 Circle setup · 11 Circle Agreement · 12 Invite members
p.6	F5 Join & draw	13 Join via link · 14 Circle recruiting · 15 The draw (commit–reveal)
p.7	F6 Active circle	16 Circle detail · 17 Pay contribution · 18 Circle ledger
p.8	F7 Money out & edges	19 Payout received · 20 Shortfall · 21 Monthly statement
p.9	F8 Admin (desktop)	22 Member 360 · 23 Ops queue · 24 Reversing entry

Reading key: solid button = primary action · grey bars = body copy placeholder · crossed box = illustration ·
ring glyph: filled = paid, outline = due, large dashed = this cycle's recipient · lettered dots = annotation, notes at right of each page

F1 — Onboarding

Goal: from store link to verified account in under three minutes. No money talk yet.

01 Welcome

02 Create account

03 Verify email

Notes

- A** Regulatory disclosure is present from screen one, footer-fixed. Copy identical everywhere it appears.
- B** Legal name captured once, used verbatim for Stripe Connect onboarding and CoP-style name matching on withdrawals. Say why we ask.
- C** Code entry, not magic link — civil-service devices often block deep links. Resend throttled to the auth rate limit (5/min/IP).

04 KYC handoff

05 Checks pending

06 Home — empty state

Notes

- A Handoff screen sets expectations before leaving the app; return deep-link lands on 05.
- B rail_status mirrored from account.updated webhooks only — UI never assumes. Neutral copy if compliance hold (no tipping off).
- C Empty home teaches the two entry paths. Wallet card renders even at zero so the safeguarding line is seen early.

F3 — Wallet

Balance from our ledger, never from Stripe. Every line answers: where is my money?

07 Wallet & activity

08 Top up

09 Withdraw

Notes

- A Descriptors are plain-English and circle-aware (ledger metadata), not bank-rail strings.
- B Cards absent by design (cost + credit-funded saving). Bacs rows always show the settlement window.
- C First-party rule surfaced as a feature, not a restriction. Mismatch renders the standard error card with remediation.

F4 — Create a circle

The coordinator's five decisions, then a plain-English agreement everyone signs.

Set up your circle

Step 1 of 2 · you can't change these after lock

Circle name

e.g. Lagos Ladies Circle

Members (3-12)

8

Contribution (GBP 20-500)

250 / month

Collection day

Last working day (payday preset)

Payout order

Random draw

Agreed order

If someone misses (grace 3 days)

Wait up to 5 days

Pay what's collected

Review agreement

10 Circle setup

Your Circle Agreement

v1 · generated from your setup · reading age 9

Each member pays

GBP 250 / month

Pot each cycle

GBP 2,000

Order decided by

Random draw (verifiable)

If a payment is late

3-day grace, then...

Ajo fee

GBP 1 per member per payout

I agree — create circle

Waiting for 5 more...

12 Invite members

Notes

- A Collection day offered as payday presets (calendar data) so the cron collects when salaries land.
- B Shortfall rule chosen up front — the MVP supports these two behaviours only; the choice is quoted back in the agreement.
- C Agreement is the contract artifact: versioned, hashed into the draw commitment, re-consent required for any change.
- D Joiners must be KYC-passed before accepting; the list shows agreement state, not just presence.

F5 — Join & the draw

The draw converts 'was it rigged?' into checkable maths. Biggest trust moment in the product.

13 Join via link

14 Recruiting

15 The draw

Notes

- A Join screen leads with the money facts a joiner actually weighs; full agreement one tap deeper, must be opened to join.
- B Commitment hash is published to every member at lock, before the draw. Same string re-shown on 15.
- C 'Verifies OK' is computed client-side from commitment + revealed seed; a 'how to check this yourself' link targets sceptics.

F6 — Active circle

One glyph carries order, progress and whose turn it is. Late is a fact, never a shaming.

16 Circle detail

17 Pay contribution

18 Circle ledger

Notes

- A Ring is one reusable component at 3 sizes (list, detail, share card). Screen-reader label: '8 members, 5 paid, Folake receives 31 July'.
- B Insufficient-balance path is inline, not a dead end; after Pay-by-Bank settles, collection retries automatically (webhook-driven).
- C This is the coordinator's notebook, public. Fees itemised as their own lines — never netted invisibly.

F7 — Money out & edge states

Payout is the promise kept. Shortfall is the promise managed. Both are designed, not defaulted.

19 Payout received

20 Shortfall

21 Monthly statement

Notes

- A** Fee shown at the moment it is charged, arithmetic visible. Reference matches the bank statement line.
- B** Copy states the rule the circle chose and its consequence; defaulter is named in the ledger (a fact) but never in push notifications to others.
- C** Statement is generated from the ledger, renders the same numbers as the app - one source of truth.

Solo-operator back office. Every action audit-logged; money corrections are reversing entries only.
